

NationWide Logistics

Complete UI Inventory — every page, every control, what it does, what it means

Prepared August 2026 · Walked live against the running application (Customer, Admin, and Pickup Partner portals) with real seeded data, not from memory or design files.

How to use this document

This is a baseline reference, not a recommendation. It documents the platform exactly as it exists today — every page, every button and what happens when you click it, every status label and what it means — so that UI redesign decisions can be made deliberately, with full knowledge of the current surface area, rather than guessing at what might already be there.

The platform has **three separate portals**, each with a different role and a different UI treatment:

- **CUSTOMER** — the public-facing shipping app: get a quote, request pickup, track shipments. Desktop-first sidebar layout, same visual system as Admin.
- **ADMIN / STAFF** — the operations back-office: orders, customers, pricing engine, pickups, reports. The largest portal by far (~30 pages).
- **PICKUP PARTNER** — the field-executive app: today's pickups, weight verification, payment collection. Deliberately mobile-first, bottom-tab navigation, large touch targets — visually distinct from the other two.

A handful of "Findings" boxes are called out throughout — these are inconsistencies or rough edges spotted while walking the live app (test data leaking into production-looking screens, a table that overflows its container, two nav items pointing at the same content). They're flagged for awareness, not fixed here — worth a look during redesign regardless of whether the visual design changes.

1 — Site Map & Navigation Structure

1.1 Public / unauthenticated pages

Route	Purpose
/	Marketing landing page — hero with tracking search, services section, testimonials, CTA, footer
/login	Shared sign-in for Customer, Staff, and Admin — routes to the right portal after auth based on the account's role
/register	Customer self-signup
/track	Standalone public tracking lookup (no header/footer chrome — a bare utility page)
/admin/login	Same shared login screen, reached via a different URL — no visual difference from /login

1.2 Customer portal — left sidebar nav

Dashboard · My Orders · My Quotes · Track a Shipment · Profile

1.3 Admin portal — left sidebar nav

Dashboard · Orders · Customers · Pickups · Payments · Tracking · Quote Requests · Pickup Requests · Pickup Partners · Pricing · Reports · Settings

Two additional pages exist but are **not** in the sidebar — reached only via links from Settings/Dashboard: Integration Health (/admin/integrations) and Audit Log (/admin/audit-logs).

1.4 Pickup Partner portal — bottom tab bar

Dashboard · Scheduled Pickups

Finding — two parallel "pickup" sections in Admin

"Pickups" and "Pickup Requests" are two separate sidebar items with almost-identical names but different data and different purposes. **Pickups** is the legacy fulfillment record (empty in current data — nothing uses this path anymore). **Pickup Requests** is the live, actively-used self-service workflow (partner assignment, verification, payment). A staff member unfamiliar with the system's history has no way to tell these apart from the nav alone.

Finding — "Providers" and "Rate Management" are the same screen

Under Pricing, both tabs render an identical provider-card grid. Confirmed by navigating directly — same layout, same data, same "Manage" buttons. One of these two tab labels is redundant.

2 — Customer Portal

Sidebar layout, dark theme, purple accent. Every screen below was walked live: registered a fresh test account, generated a real quote, submitted a real pickup request, and tracked a real shipment.

[/dashboard](#) — Dashboard

What it shows: A greeting ("Welcome back, [name]"), three large quick-action cards (My Orders / Track a Shipment / My Profile — each just a shortcut link), and a "Recent orders" panel showing the customer's own orders or an empty state ("No orders yet").

Top bar: present on every customer page — a notification bell (no dropdown content observed) and an avatar with initials. Clicking the avatar opens a small menu: the account's email + role label, "Profile & Settings", and "Log out".

[/quote](#) — Get a Shipping Quote (3-step wizard)

A stepper at the top (Destination → Weight → Compare Quotes) tracks progress; completed steps show a checkmark.

Step 1 — Destination: a search box filters a full country list (each row shows the country name and its 2-letter code with a globe icon). Selecting one and pressing Continue advances.

Step 2 — Parcel details: a summary card recaps the chosen destination with a "Change" link back to step 1. Below it: a Shipment Type dropdown (Document / Parcel / Package / Other) and a Weight field (numeric, kg). A note explains "Your final shipping price may be confirmed after physical verification during pickup." Button: **Get Quotes**.

Step 3 — Compare Quotes: up to three carrier option cards (in the live test: FedEx, UPS, DHL) each showing the carrier name and calculated INR price; the cheapest is marked **BEST PRICE**. Each card has a "Select [Carrier]" button.

After selecting a carrier — a fourth, unlabeled step appears (not represented in the stepper) titled "Shipment details": a read-only recap of shipment type/destination, an optional Contents field, then a full Recipient block (name, phone, address line 1/2, city, state, postal code). Continue creates the quote and moves straight into the pickup-request flow (see below) — there is no separate "quote created" confirmation screen in between.

[/pickup-request/\[quoteId\]](/pickup-request/[quoteId]) — Schedule your pickup

Reached automatically right after a quote is created (there's no way to navigate here on demand except through that flow). A "Back" link returns to the quote detail page.

Sections: Pickup Contact (name, phone) · a checkbox *"I'll drop the parcel at the warehouse instead"* that toggles the address fields below · Pickup Address (house/street, landmark, city, state, postal code) · Pickup Date (native date picker) and Time Slot (dropdown: 9AM–12PM / 12PM–3PM / 3PM–6PM) · Pickup Instructions (optional free text). Button: **Submit Pickup Request**.

On submit — a confirmation screen replaces the form entirely: a green checkmark icon, the headline *"Your pickup request has been received successfully."*, subtext *"Our pickup partner will contact you shortly to collect your parcel."*, and a single button, **Track this request**.

[/quotes/\[id\]](/quotes/[id]) — Pickup / Quote status pipeline

Reached via "Track this request" or from the Quotes list. Shows the destination as a heading ("To New York"), a summary line (shipment type · weight · request date), and a status pill (e.g. **PICKUP REQUESTED**).

Pickup progress — a fixed 9-step vertical checklist, each step either checked (green circle) or pending (empty circle), no percentage or bar — just a literal list: Pickup Requested → Pickup Scheduled → Pickup Partner Assigned → Pickup In Progress → Weight Verified → Payment Received → Shipment Accepted → Order Generated → Tracking Active. In the live test, the first three were already checked immediately on submission — pickup scheduling and partner assignment currently happen automatically (there's only one active pickup partner configured), not as separate customer-facing waiting states.

</quotes> — My Quotes (list)

A "Request a quote" button (top right) plus one row per quote: destination summary, type/weight/date, a status pill, and a "View" link into the pipeline page above. No filters or search on this list.

</orders> — My Orders (list)

Header shows a live count ("0 orders"). Empty state: a package icon, "No orders yet", "Your orders will show up here once you place one." **Important distinction verified live:** a submitted pickup request does *not* appear here — this list only populates once a pickup partner has physically verified and accepted the parcel, at which point a real Order is generated. Before that point, everything lives under "My Quotes" instead.

[/tracking](#) — Track a Shipment

A single search field ("Enter your tracking number") and a Track button. On a valid lookup: a card with the tracking number, a status pill (e.g. "Picked Up"), a "Last updated" timestamp, and a chronological event list below (each event: status name, timestamp, and location — e.g. "Picked Up · 09/08/2026, 05:30:00 — Origin Facility, Mumbai").

[/profile](#) — Profile

Personal information card: Name, Phone (greyed out / not editable — it's the account's login identifier), Email, Address, and a **Save changes** button.

Change password card: Current password, New password, Confirm new password (each with a show/hide eye toggle), and a **Change password** button.

3 — Admin Portal

The largest portal — full-height left sidebar, top bar with a breadcrumb-style page title, notification bell, and an avatar menu (email + role, "Profile & Settings", "Log out" in red). Every list page below that has real data was confirmed against the live database (79 orders, 21 customers, 5 quote requests at time of writing).

</admin/dashboard> — Dashboard

8 KPI cards in a 4-column grid: Total Orders, Orders In Transit, Orders Delivered, Total Customers, Scheduled Pickups, Warehouse Drop-offs, Pending Payments, Quote Requests — each a plain number with an icon, no trend indicator.

Quick actions — 7 shortcut cards: Create Order, Track Shipment, Generate Quote, View Customers, View Payments, Schedule Pickup, Create Shipment Request.

Recent activity — a live feed of the most recent audit-log-style events (e.g. "pickup request partner assigned — PickupRequest d8ee5341", actor email, timestamp).

</admin/orders> — Orders (list) → [/admin/orders/\[id\]](/admin/orders/[id]) (detail)

List: "Create Order" button · search (order/customer/tracking) · status filter (Pending/Confirmed/Completed/Cancelled) · provider filter · sortable columns (Order ID, Customer, Status, Created) · pagination footer. Columns: Order ID, Customer, Origin, Destination (both currently always "—" — not captured by the data model yet), Provider, Status pill, Created date, View link.

Detail: deliberately minimal — order ID, status pill, created timestamp, a Customer card (name links to that customer's profile, plus phone), and a Shipments card (tracking number link, provider, live tracking-status pill). **No payment information and no edit actions live on this page** — payment status is edited entirely from the separate Payments page (below).

</admin/customers> — Customers (list) → [/admin/customers/\[id\]](/admin/customers/[id]) (detail)

List: "New Customer" button, search box, columns Name/Phone/Email/Customer Since/Actions, pagination.

Detail: Personal information card (Phone, Email, Address, Consent — "Given [date] via [source]", an "Edit" button), and a "Shipment history" panel below (empty state observed: "No orders yet").

</admin/pickups> — Pickups (legacy)

Two tabs, Pickups and Warehouse Drop-Offs, each with date and status filters. Empty in current data (see Finding above) — the active pickup workflow now lives entirely under Pickup Requests instead.

</admin/payments> — Payments

Subtitle: *"Payment status per order. No online payment gateway yet — mark payments received manually."* Search + status filter (Pending/Paid/Failed/Refunded). Columns: Order, Customer, Amount, Method, Status pill, Actions.

"Mark Paid" opens a dialog: "Mark payment as paid" · Order [id] · Amount field (numeric) · Payment method dropdown (default Cash) · Cancel / Confirm paid buttons.

</admin/shipments> — Tracking

A single lookup field ("Internal tracking number, e.g. NW-DEMOTRACK1") + Look up button. Results show three panels:

- **Tracking summary** — number, status pill, "Refresh Tracking" button, linked order, provider (external link), current location, estimated delivery, last synced timestamp.
- **External tracking numbers** — the raw carrier AWB/tracking number(s) mapped to this shipment.
- **Tracking timeline** — chronological event list, each with a "raw:" line showing the unprocessed carrier status code alongside the normalized one.

Right-hand action panels: *Map carrier tracking number* (provider dropdown + AWB/tracking-number field + Map button) and *Manually override status* (status dropdown, optional location, optional reason, "Override status" button) — this is the staff tool for correcting a shipment's status by hand.

</admin/quotes> — **Quote Requests (list)** → [/admin/quotes/\[id\]](/admin/quotes/[id]) (detail), </admin/quotes/new> (wizard)

List: "New Quote" button, search, status filter (Submitted/Rated/Needs manual review/Quoted/Accepted/Rejected/Cancelled). Columns: Customer, Route, Weight, Review Reason, Status pill, Quoted amount, View.

Detail: Customer card (name, phone, email), Shipment card (type, weight), side-by-side Origin/Destination cards (Origin shows a placeholder note if the customer hasn't submitted a pickup request yet — origin is only captured at that point), and a Fulfillment card below.

New Quote wizard: step 1 is a searchable customer picker (name/phone/email) with a "+ New Customer" shortcut — this reuses the exact same pricing engine as the public customer-facing quote wizard, per the page's own subtitle.

</admin/pickup-requests> — **Pickup Requests (list)** → [/admin/pickup-requests/\[id\]](/admin/pickup-requests/[id]) (detail)

List: search, status filter (8 states: Pending Assignment / Assigned / Scheduled / Out for Pickup / Verification Pending / Completed / Cancelled / Rejected). Columns: Customer (+phone), Pickup Address, Carrier, Quote amount, Assigned Partner, Status pill, Requested date.

Detail: an "Assignment" card ("Currently assigned to [Partner]") and a "Pickup Details" card (Pickup Address, Scheduled date/time, Carrier, Destination, Estimated Quote). This is the staff-side read-only mirror of what the pickup partner is doing in their own app — no edit actions were found here beyond assignment.

</admin/pickup-partners> — **Pickup Partners (list only, no detail page)**

"New Partner" button. Columns: Name, Email, Phone, Status (Active/Inactive pill), Actions (Deactivate / Reactivate). No edit or detail drill-down exists for an individual partner beyond this row.

3.1 — Pricing (7 sub-tabs, the deepest and most complex section)

All under /admin/pricing/*, sharing a consistent tab bar: Dashboard · Providers · Countries · Zones · Rate Management · Fuel & PSS · PDF Generator · Rate History.

Dashboard tab

A search box ("Search a provider or country..."), 6 quick-action cards (Update Rates, Generate Rate Card PDF, Update Fuel & PSS, Add Country, Add Zone, View Rate History), and 7 stat cards: Total Providers, Active Countries, Total Zones, Total Rate Cards, Last Updated, Pending Changes, Last Generated PDF.

Providers tab (identical to Rate Management tab) → Provider detail → Country detail → individual Rate detail/edit

Providers tab: one card per shipping provider (DHL, DHL Express, FedEx, UPS in current data) showing Fuel Charge %, PSS (₹/kg), Active Countries count, Last Updated, and a "Manage" button. "New provider" button top-right.

Provider detail: the same 4 stats as a header strip, "Edit configuration" and "Recent updates" buttons, then a full list of every country configured for that provider — each row shows the assigned zone, a weight-category count, which shipment types have rates (document/parcel/package), an Active pill, and a "Manage" button.

Country detail (e.g. FedEx → Afghanistan): shipment-type tabs (Document/Parcel/Package, each labeled with its weight-slab count), a "Weight Categories" list (each slab shown as a range + price chip), "Bulk Edit" and "+ Add weight category" buttons.

Individual rate edit (one specific weight slab): a two-column layout — left side is the edit form (Fixed Rate, GST %, NationWide Margin, an optional "Reason" field for the change, Deactivate / Cancel / Save Changes buttons); **right side is a live "Final Calculated Price (Preview)" breakdown** that recalculates as you type — Base Rate → PSS → Fuel Charge → Taxable Subtotal → GST → NationWide Margin → Final Price. This transparency panel is one of the more distinctive pieces of UI in the whole admin portal.

Countries tab

A flat table — Code, Name, Status pill, Edit button — with a "New country" button. **249 rows, no search box and no pagination on this specific tab** (unlike the Zones/Providers views).

Zones tab

A provider picker dropdown at the top, then a table scoped to that provider: Zone name, Countries count, "Manage countries" and "Rename" actions. "New Zone" button.

Fuel & PSS tab

Explanatory text: *"Fuel Charge % applies to Base Rate only; PSS is a flat rate per kg. Both apply automatically to every quote for that provider — there's nothing to set per rate."* One card per provider (Fuel Charge %, PSS, Last Updated, "Update" button opening an edit form).

PDF Generator tab (Generate / History sub-tabs)

Generate: a form — Provider dropdown, Shipment Type dropdown, Countries multi-select (disabled until a provider is chosen), Effective From date, Template dropdown ("Classic" only — "More templates coming soon"), Preview and Generate & Download buttons. A "Rate Card Settings" link opens a separate dialog (see below).

Recently Generated panel (right column): version number, countries covered, effective date, Download link — for each previously generated PDF.

Rate Card Settings dialog (company branding used on every generated PDF): Logo upload, Company Name, Tagline, Primary Brand Colour (swatch + hex), Website, Support Email, Support Number, Company Address, then four long-form text areas — Terms & Conditions, Insurance Disclaimer, Restricted Items Notice, Legal Disclaimer.

Rate History tab

Search box (admin email or action), From/To date filters, and a table: Provider, Zone, Date, Changed By, Change, Reason. The "Change" column shows a **raw JSON before/after diff** (e.g. `{"pssPerKg":0,...}` → `{"pssPerKg":100,...}`) rather than a formatted description.

</admin/reports> — Reports

4 KPI cards (Orders Today, Orders This Week, Completed Deliveries, Total Customers), a Revenue card ("Total from orders marked paid"), two 7-day bar charts (Shipment trends, Customer growth — Mon through Sun), and a "Provider statistics" bar chart below.

</admin/settings> — Settings

Five cards: Manager profile (read-only, avatar/email/role) · Change password (same 3-field pattern as the customer portal) · Provider settings (a link out to Integration Health) · System information (a link out to the Audit Log) · Notification preferences ("Coming soon") · API settings ("Coming soon") · Session ("You're currently signed in on this device", red Log out button).

</admin/integrations> — **Integration health** (linked from Settings, not in the sidebar)

Live call metrics for the ICL carrier adapter: Provider, Calls (last window), Successes, Errors, Error rate, Avg latency, Last call, Last error.

</admin/audit-logs> — **Audit log** (linked from Settings, not in the sidebar)

Subtitle: *"Every staff mutation, recorded for compliance."* A wide table: When, Actor, Action (e.g. `PICKUP_REQUEST_PAYMENT_COLLECTED`), Entity (type + id), Change.

Finding — the Change column overflows the page

Like Rate History, this column renders a raw JSON diff and is wide enough that it runs off the right edge of the viewport at standard desktop width — the table has no horizontal scroll affordance, so the tail of longer diffs is simply not visible without a very wide screen.

Finding — leftover test data visible in "production" screens

Two places in the admin UI currently show data that was clearly created for automated/manual testing, not real use: the customer-facing country picker ([/quote](#)) lists entries named "E2E Pickup Request Test Country" and "E2E Quotes Test Country" alongside real countries; and the Rate Card Settings dialog's Company Name field is populated with "E2E Test Co". Neither is a redesign concern per se, but worth a data-cleanup pass before this goes in front of a real customer or gets used as the reference for what "real" content in each field looks like.

4 — Pickup Partner Portal

Deliberately different visual language from the other two portals: full-bleed mobile layout, a fixed bottom tab bar (Dashboard / Scheduled Pickups) instead of a sidebar, large single-column cards, big primary-action buttons sized for touch. Walked live start-to-finish: arrived at a real pickup, verified weight, collected payment, and completed the checklist.

</partner/dashboard> — Dashboard

Greeting ("Good morning, [name]"), 3 stat cards (Today / Pending / Collected Today — the last one in ₹), an "Upcoming" list grouped by date (e.g. "Sat, 15 Aug — 1 pickup"), and a "View all pickups" link.

</partner/pickups> — Scheduled Pickups (list)

Filter chips: Today / Tomorrow / Upcoming / All, plus a search box (name, address, or ID). Each pickup is a card grouped under its date: customer name, scheduled date/time, a location pin + address, shipment type + weight, a status pill, and the quoted amount in large text.

[/partner/pickups/\[id\]](/partner/pickups/[id]) — Pickup detail (3-step in-app flow)

A horizontal 3-step progress tracker runs across the top of every state: **Arrived → Payment → Complete**. A status pill in the top-right reflects the underlying workflow state (Assigned → Out For Pickup → Verification Pending → Completed).

Step 1 — before arrival: Customer card (name, tap-to-call phone number), Pickup Address, Scheduled date/time, Shipment Type, Declared Weight, Carrier, Quoted Amount. Primary button: **Arrived at Pickup**. A "Reject Pickup" section (reason text field + button) is present at every step of this flow, not just here.

Step 2a — weight verification (appears after "Arrived"): shipment-type tabs (read-only recap), a "Verified Weight" stepper (-/+ buttons around a numeric field), an optional Pickup Notes field, and a required **"Parcel Verified — I have physically checked this parcel"** checkbox that gates the Confirm button. The moment the verified weight differs from the customer's declared weight, a price panel appears showing Original Quote, Updated Amount, and the Difference (highlighted, e.g. "+INR 287") — this is the live re-pricing the whole workflow is built around.

Step 2b — payment collection: a large "Amount To Collect" figure, a Payment Method toggle (Cash / UPI), and a **"Mark Payment Collected"** button that opens a confirmation dialog ("Amount: ₹X · Method: Cash. Are you sure the payment has been received?" — Cancel / Confirm Payment).

Step 3 — final acceptance: a "Pickup Summary" recap (Customer, Verified Weight, Service, Final Amount, Payment method, Payment Status, Pickup Address) and a "Final Checklist" — five checkboxes (Parcel packed properly, Restricted items checked, Documents verified, Fragile, Insurance required) plus an optional Remarks field. Final button: **Complete Pickup** — this is the action that actually generates the real Order and tracking number; nothing before this point in the entire customer journey is a trackable shipment yet.

5 — Cross-Cutting Observations

A few patterns worth knowing before redesigning, since they cut across multiple pages rather than living in just one:

5.1 Visual system

- Dark theme throughout, all three portals — near-black background, a single indigo/purple accent color used for primary buttons, active nav state, links, and focus rings.
- Status is communicated almost entirely through small pill/badge components with a consistent color language (blue-ish for "in progress" states, green for terminal-success, amber/orange for "pending action", red reserved for destructive actions like Log out).
- Every list page that has one follows the same shape: a search box + 0–2 filter dropdowns, a table, and (where paginated) a "Showing X–Y of Z" footer with Previous/Next.
- Admin and Customer share one design system exactly (same components, spacing, typography). Pickup Partner is visually its own thing — mobile card-and-tab-bar pattern, not a shrunk-down version of the desktop admin UI.

5.2 Navigation depth

The deepest path in the product is `Pricing → Providers → [provider] → [country] → [weight slab]` — four levels of drill-down to edit a single rate. Each level is its own page (not a modal/drawer), each with its own "Back to X" link at the top rather than relying solely on the breadcrumb.

5.3 Confirmation patterns

Two different confirmation patterns are used for destructive/consequential actions: a full modal dialog with Cancel/Confirm (seen in Payment collection, Mark Paid) versus no confirmation at all for some actions (e.g. Deactivate/Reactivate on Pickup Partners appears to fire immediately). Worth deciding on one consistent pattern.

5.4 What's explicitly unfinished today

- Notification preferences and API settings (Admin → Settings) — both show "Coming soon" placeholders.
- Rate Card templates — only "Classic" exists; the dropdown itself already anticipates more ("More templates coming soon").
- Order Origin/Destination columns in the Admin Orders list always render "—" — not yet captured anywhere in the data model.
