Subject: Tracking API credentials are not authenticating

Hi team, thank you for the Tracking API documentation and demo request/response examples. We've integrated against the confirmed endpoint and request format, but the credentials provided for the Tracking API do not authenticate on either your production or UAT host. Details below.

What you provided

```
POST http://cloud.iclinternational.in/api/v1/Tracking/Tracking
```

```
{"UserID": "test", "Password": "test@99", "AWBNo": "21206253"}
```

What we tested

1. The given URL redirects (302) from http to https — noted, not an issue.
2. Posting the exact given credentials to https://cloud.iclinternational.in returns HTTP 200 with ErrorCode "1", ErrorDisc "Invalid User ID / Password".
3. The same credentials against your UAT host (uatcloud.iclinternational.in) return the identical rejection.
4. Adding a CustomerCode field to the request makes no difference — the rejection happens at login, before any AWB lookup.
5. As a control, we tried the UAT sandbox credentials (UserID `TEST1` / Password `test`) from our earlier Booking API exchange against this same Tracking endpoint — authentication succeeded, and using AWB 6000005372 from that same exchange returned a complete, real tracking record.

What we need

Could you please confirm a working UserID/Password pair for the Tracking API — ideally on whichever environment holds AWB 21206253 from your own example — or confirm that `TEST1` / `test` is the correct credential to use going forward? We're ready to switch our integration over as soon as we have a login that authenticates.

Thanks,
